

Multiple Warehouse Inventory Management

Magento 1

Installation Procedure

You should never install an extension directly onto your production website. Please install this extension onto a staging version of your website and verify it's compatibility.

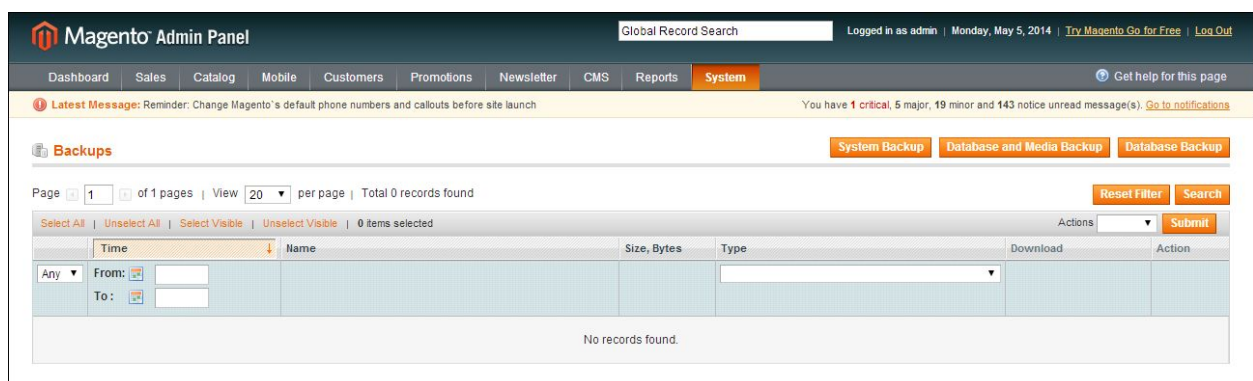

Taking Backups

Take a Backup Of Your Database

Most extensions will modify your database and some complex extensions will modify Magento's Db Tables. It's important that you take a backup of your website database before attempting an install.

To take a backup with Magento's built in backup tool, navigate to [Admin Panel > System > Tools > Backups](#).

Database backup files are compressed using the .gz format. The .tgz format is used for system, database, and media backups. Backup files are stored in the var/backups directory in your Magento file system. The files that are stored in the /var/cache, /var/log, /var/session and /var/report folders are excluded from the backup.

To Create a Single Backup

1. Click one of the following buttons, depending on the type of backup you need to create:

1. System Backup will create a .tgz of the entire source code and the database.
2. Database and Media Backup will create a .tgz containing a database backup and the contents of the media directory
3. Database Backup will backup only the database

2. When prompted that the backup will take time, click OK to continue.

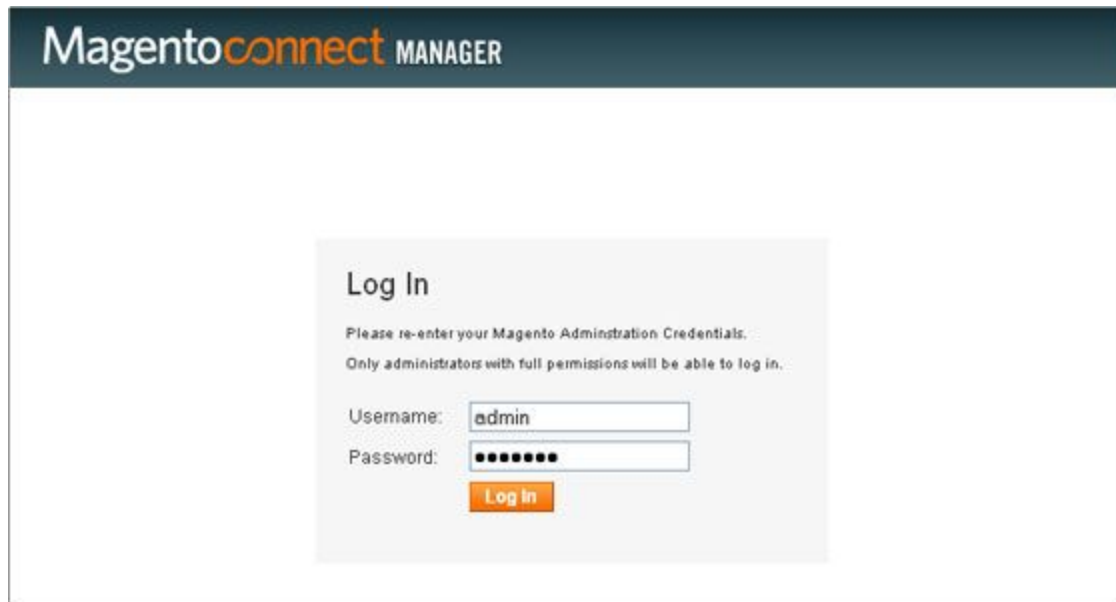

3. To put the store into maintenance mode during the backup, select the checkbox. After the backup is created, maintenance mode is turned off automatically.

4. If you are creating a system backup, select the Include Media folder to System Backup checkbox if you want to include the media folder. When prompted, confirm the action.

All backups are listed on the Backups page. Deleting a record from the list deletes the archive file as well.

Take a Backup Of Your Database With Connect Manager

If the option above was not available to you, this option may be easier.

1. On the Admin menu, select [System > Magento Connect > Magento Connect Manager](#).
2. Select the Create Backup checkbox and select the backup type.
3. Proceed with an extension installation or Magento update. The backup is created automatically and available at [System > Tools > Backups](#).

Disable Magento Cache

1. From the Admin Panel, select [System > Cache Management](#).

5. It's important that you disable server cache mechanisms such as [APC Cache](#), [Varnish Cache](#) or even [CDNs](#) that are loading cached copies of your website. All of these caching mechanisms can cause unwanted effects during an installation, even crippling a database and forcing a developer to repair your store.

Disable Magento Compiler

1. Navigate to [System > Tools > Compilation](#) and click on then [Disable](#) button.

Enable Installation Logs

Enabling the Magento Error logs will provide us with an exact sequence of events that your store went through while attempting to install an extension. If everything goes to plan you can disable the logs, but if something breaks these logs will be indispensable to our recovery efforts.

1. From the Admin Area go to **System > Configuration > Advanced > Developer > Log Settings**.
2. Find the configuration option labeled **Enabled** and change the dropdown to **Yes**.
3. Click the **Save Config** button and wait for the page to reload. You have successfully enabled error logging and installation logs.

Download Your Purchased Extension

Immediately after your purchase you were provided with a download link of your new software. This download will contain one to many extension folders and documentation for each of the extensions.

If you did not download your software at the time of purchase you can log into your account with us and download copy. Your download will be available for 12 months following your purchase. If it has been 12 months since your last

purchase you will need to purchase the software again to reactivate your download.

Log into your Mage Plugins customer account here,
<https://mageplugins.net/customer/account/>.

In the left menu of your customer account choose **My Downloadable Products**. This will display a complete list of the products which you've purchased in the last twelve months. Click on the extension which you would like to install and your download will start.

Install The Extension

1. Copy The Extension Files. In the compressed archive which you downloaded you will see one to many extension folders. Within each of these folders is an exact replica of the Github Repository that we use for developing the extension.

You may delete/ignore any files that are UPPERCASE and/or end with **.md**. These files are relevant to development only.

The documentation files that you're reading right now exist under the **/docs** folder within each extension directory. You will receive this exact documentation when you purchase and download the extension. You may read these docs offline.

All other files and folders within each extension directory are important to the successful installation of your new software. Copy and paste, or drag these files into the WEBROOT of your magento installation.

Your extension files are now installed and your extension is ready to be installed into your database.

2. Access your Admin Area to complete the database installation procedure for your extension.

To confirm that your extension has installed, go to [System > Configuration > Advanced > Advanced](#). The modules that you just copied the files for will be listed here if Magento is recognizing them.

3. Log Out and Log Back In Now that your extension has been installed, log out of your admin area and log back into it. Once you've completed this action you may re-enable the compiler, your magento cache and any other cache mechanisms that you had disabled.

Your installation is now complete.

Uninstallation Procedures

Prepare for Uninstallation

1. Disable Magento's Cache
2. Disable the Magento Compiler
3. Disable any caching mechanisms that are running on your server

Disable The Extension

1. Open the file `app/etc/modules/Innoexts_ShippingTablerate.xml` in a file editor.

2. Exchange the line

```
<active>true</active>
```

with

```
<active>false</active>
```

3. Delete the cache directory `var/cache` and this will disable the extension completely.
4. Verify that your webstore is operating properly without the extension by creating a sales order. You should not longer be able to see the admin offline payment option when creating an order.
5. If everything is operating properly you may delete the extension files which are outlined in the file structure above.
